

Send Local Project to Remote Repository

1. Prerequisites

Make sure you have:

- Git installed and configured (`git --version`)
- A GitHub / GitLab / Bitbucket account
- A **remote repository** already created on that platform (empty)

Example remote URL formats:

- **HTTPS:** `https://github.com/username/repo-name.git`
- **SSH:** `git@github.com:username/repo-name.git`

2. Initialize Git in Your Local Project

If your project folder isn't yet a Git repository:

```
cd path\to\your\project
git init
```

This creates a hidden `.git` folder — it tells Git to start tracking the project.

3. Add and Commit Files

Stage all files for tracking:

```
git add .
```

Commit with a message:

```
git commit -m "Initial commit"
```

4. Add the Remote Repository

Link your local project to the remote repo:

```
git remote add origin https://github.com/username/repo-name.git
```

Verify connection:

```
git remote -v
```

You should see something like:

```
origin  https://github.com/username/repo-name.git (fetch)
origin  https://github.com/username/repo-name.git (push)
```

5. Set the Default Branch Name (if needed)

If your repo uses **main** (recommended):

```
git branch -M main
```

6. Push Local Project to Remote Repository

Upload your local commits to the remote:

```
git push -u origin main
```

Explanation:

- `origin` = name of the remote repo
- `main` = branch name
- `-u` sets tracking so you can later just use `git push` and `git pull`

7. Verify on Remote

Go to your GitHub (or GitLab) repository page —
you should now see all your project files there

8. Common Commands

Purpose	Command
Initialize Git repo	<code>git init</code>
Stage all files	<code>git add .</code>
Commit files	<code>git commit -m "message"</code>
Add remote	<code>git remote add origin <repo-url></code>
Rename branch to main	<code>git branch -M main</code>
Push project to remote	<code>git push -u origin main</code>
Verify remote connection	<code>git remote -v</code>
